

Chemical structure of 4-chlorobenzamide N-(2,2-dichloroethyl)carbamate. The structure consists of a benzene ring substituted with a chlorine atom (Cl) at the para position and a carbonyl group (C=O) at the other end. The carbonyl group is part of a carbamate linkage, connected to an N-(2,2-dichloroethyl) group. The 2,2-dichloroethyl group is represented by a carbon atom bonded to two chlorine atoms (Cl) and an ethyl chain.
