

The chemical structure is a complex polycyclic molecule, likely a steroid derivative. It features a fused ring system consisting of a cyclohexane ring, a five-membered ring, and a six-membered ring. The structure is highly branched and includes several functional groups: a hydroxyl group (OH) attached to a carbon atom, a ketone group (C=O) attached to a carbon atom, and an amine group (NH) attached to a carbon atom. The molecule is drawn in a skeletal structure format, with carbon atoms represented by vertices and hydrogen atoms implied. The overall structure is a complex, branched polycyclic molecule.
