

The graph illustrates a complex molecular structure with the following components:

- Atoms:** Oxygen (O), Nitrogen (N), Silicon (Si), Hydrogen (H), and Fluorine (F). Atoms are labeled with subscripts (e.g., O_1, N_1, Si_1, H_1, F_1) to distinguish between different instances of the same element.
- Bonds:** All connections between atoms are labeled "Single", indicating single bonds.
- Structure:** The molecule features a large central ring system composed of Si, N, and O atoms. This central core is highly branched, with various side chains extending from it. These side chains include:
 - A ring containing O, N, and Si atoms on the left.
 - A chain of Si and N atoms at the bottom left.
 - A chain of Si and N atoms at the top.
 - A chain of Si and N atoms on the right, terminating in a fluorinated group (F_1, F_2, F_3).
 - A chain of Si and N atoms at the bottom right, terminating in a fluorinated group (F_1, F_2, F_3).
