Hypothesis

Relative Criteria

Methodology
Clustering Indices -
Hard Clustering

Questions

- ▶ Test a parameter against a specific value
- ▶ Begin with H_0 and H_1 as the null and alternative hypotheses

- ▶ Power function:

$$W(\theta) = P(q \in \bar{D}_p | \theta \in \Theta_1)$$

- ▶ Goal: make correct decision

Hypothesis Testing in Cluster Validity

- ▶ Test whether the data of X possess a random structure
- ▶ First step: generate data to model a random structure
- ▶ Second step: define a statistic and compare results from our data set and a reference set
- ▶ Three methods exist to generate the population under the randomness hypothesis
- ▶ Choose best method for the situation

Questions

Random Position Hypothesis

Cluster Validity
10/14/2010
6

Erin Wirch &
Wenbo Wang

- ▶ Suitable for ratio data
- ▶ Requirement: “All the arrangements of N vectors in a specific region of the l -dimensional space are equally likely to occur.”
- ▶ This can be accomplished with random insertion of points in the region according to uniform distribution
- ▶ Can be used with internal or external criteria

Questions

Random Graph Hypothesis

- ▶ Suitable when only internal information is available
- ▶ Definition: $N \times N$ matrix A as symmetric matrix with zero diagonal elements
- ▶ $A(i,j)$ only gives information about dissimilarity between x_i and x_j
- ▶ Thus comparing dissimilarities is meaningless

Questions

Random Graph Hypothesis, cont'd

Cluster Validity
10/14/2010
10

Erin Wirch &
Wenbo Wang

- ▶ Let A_i be an $N \times N$ rank order without ties
- ▶ Reference population consists of matrices A_i generated by randomly inserted integers in the range $[1, \frac{N(N-1)}{2}]$
- ▶ H_0 rejected if q is too large or too small

Questions

Random Label Hypothesis

- ▶ Consider all possible partitions, P' of x in m groups
- ▶ Assume that all possible mappings are equally likely
- ▶ Statistic q can be defined to measure degree information in X matches specific partition
- ▶ Use q to test degree of match between P and P' against q_i 's corresponding to random partitions
- ▶ H_0 rejected if q is too large or too small

Hypothesis

Relative Criteria

Methodology
Clustering Indices -
Hard Clustering

Questions

- ▶ cluster size m is not pre-determined in the algorithm
- ▶ criteria: the clustering structure is captured by a wide range of A

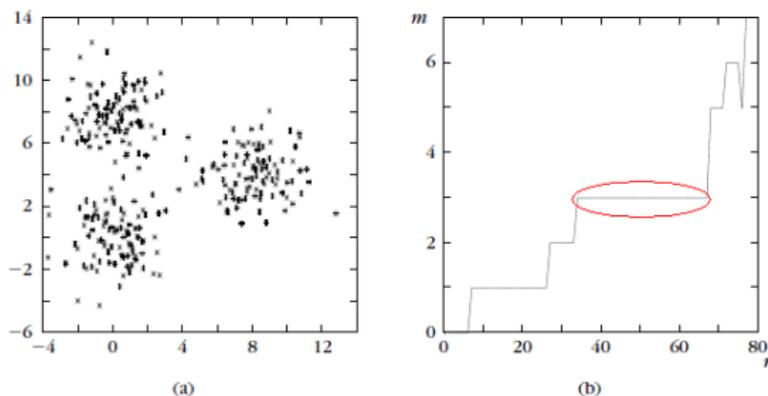

Figure: (a) 2-D clusters from normal distributions with mean $[0, 0]^T$, $[8, 4]^T$ and $[8, 0]^T$, covariance matrices $1.5I$. (b) clustering result (cluster size m) with binary morphology algorithm, with respect of different resolution parameters r

- ▶ Comparing by data set with a wider range of variance:

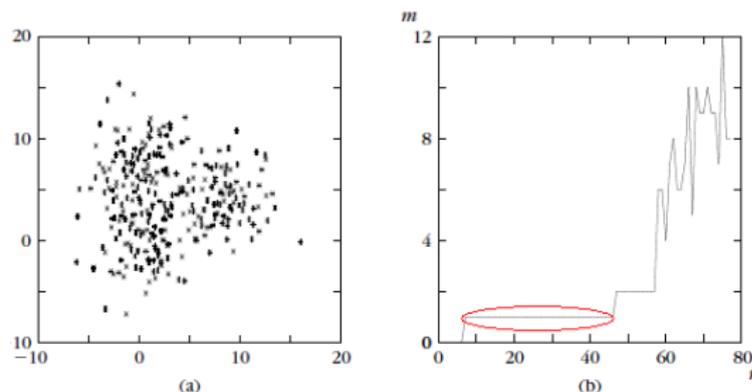

Figure: (a) 2-D clusters from normal distributions with mean $[0, 0]^T$, $[8, 4]^T$ and $[8, 0]^T$, covariance matrices $2.5I$. (b) clustering result (cluster size m) with binary morphology algorithm, with respect of different resolution parameters r

Hard Clustering

Questions

- ▶ cluster size m is pre-determined in the algorithm
- ▶ criteria: to choose the best clustering index q in the range of $[m_{min}, m_{max}]$
 - ▶ if q shows no trends with respect of m , vary parameter A for each m , choose the best A
 - ▶ if q shows trends with respect of m , choose m where significant local change of q happens

Method II (cont')

- Clustering Indices - Hard Clustering

Questions

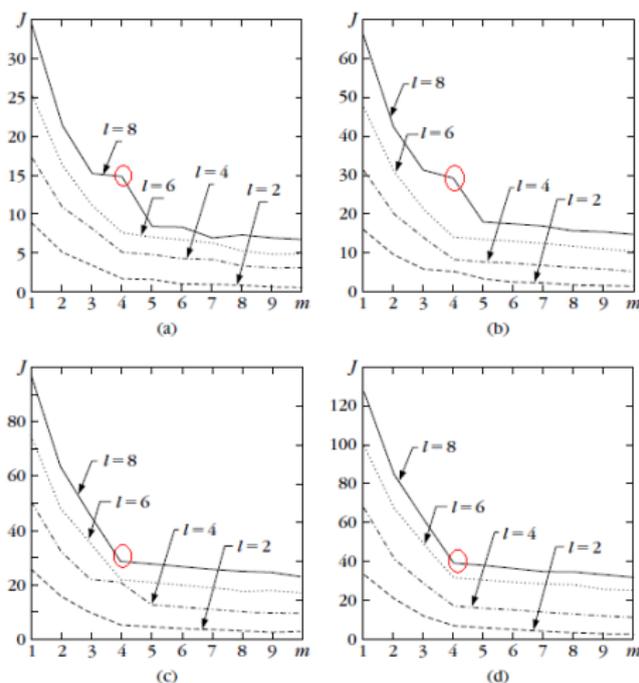

Figure: data set generated from 4 well-separated normal distributions (feature size $l \in \{2, 4, 6, 8\}$) (a) $N = 50$ (b) $N = 100$ (c) $N = 150$ (d) $N = 200$. The sharp turns indicate the clustering structure

Method II (cont')

Outline

Hypothesis Testing

- Random Position Hypothesis
- Random Graph Hypothesis
- Random Label Hypothesis

Relative Criteria

- Methodology
- Clustering Indices - Hard Clustering

Questions

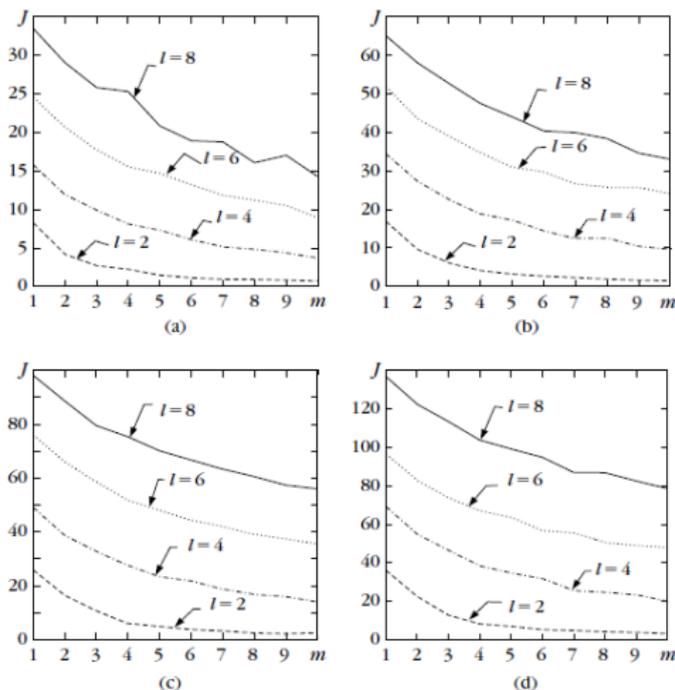

Figure: data set generated from 4 poorly-separated uniformed distributions (feature size $l \in \{2, 4, 6, 8\}$) (a) $N = 50$ (b) $N = 100$ (c) $N = 150$ (d) $N = 200$. No sharp turn exhibited

- ▶ The modified Hubert Γ statistic: correlation between proximity matrix P and cluster distance matrix Q

- ▶ $P(i, j) = d(x_i, x_j)$, $Q(i, j) = d(c_{x_i}, c_{x_j})$

$$\Gamma = (1/M) \sum_{i=1}^{N-1} \sum_{j=i+1}^N X(i, j) Y(i, j) \quad (1)$$

- ▶ The Dunn and Dunn-like indices

- ▶ dissimilarity function between two clusters:

$$d(C_i, C_j) = \min_{x \in C_i, y \in C_j} d(x, y)$$

- ▶ diameter of a cluster C :

$$\text{diam}(C) = \max_{x, y \in C} d(x, y)$$

- ▶ Dunn index:

$$D_m = \min_{i=1, \dots, m} \min_{j=i+1, \dots, m} \frac{d(C_i, C_j)}{\max_{k=1, \dots, m} \text{diam}(C_k)} \quad (2)$$

- ▶ The Davies-Bouldin(DB) and DB-like indices:
 - ▶ s_i is the measure of the spread around its mean vector for cluster C_i
 - ▶ dissimilarity function between two clusters: $d(C_i, C_j)$
 - ▶ the similarity index R_{ij} between C_i, C_j has the property:
 - ▶ if $s_j > s_k$ and $d_{ij} = d_{ik}$ then $R_{ij} > R_{ik}$
 - ▶ if $s_j = s_k$ and $d_{ij} < d_{ik}$ then $R_{ij} > R_{ik}$
 - ▶ choose $R_{ij} = \frac{s_i + s_j}{d_{ij}}$, $R_i = \max_{j=1, \dots, m, j \neq i} R_{ij}$

$$DB_m = \frac{1}{m} \sum_{i=1}^m R_i \quad (3)$$

- ▶ The DB-like indices based on MST
 - ▶ $R_{ij} = \frac{s_i^{MST} + s_j^{MST}}{d_{ij}}$
 - ▶ $DB_m^{MST} = \frac{1}{m} \sum_{i=1}^m R_i^{MST}$

Questions

Hard Clustering Indices (Cont')

- ▶ The silhouette index
 - ▶ a_i is average distance between x_i and the rest elements of the cluster C_j

$$a_i = d_{avg}^{ps}(x_i, C - x_i) \quad (4)$$

- ▶ b_i is average distance between x_i and its closest cluster C_k

$$b_i = \min_{k=1, \dots, m, k \neq C_j} d_{avg}^{ps}(x_i, C_k) \quad (5)$$

- ▶ the silhouette width of x_i

$$s_i = \frac{b_i - a_i}{\max(b_i, a_i)} \quad (6)$$

- ▶ $S_j = \frac{1}{n_j} \sum_{i: x_i \in C_j} s_i$, $S_m = \frac{1}{m} \sum_j^m S_j$

Hard Clustering

Questions

Hard Clustering Indices (Cont')

- ▶ The Gap indices:
 - ▶ sum of distance between all pairs within the same cluster:

$$D_q = \sum_{x_i \in C_q} \sum_{x_j \in C_q} d(x_i, x_j) \quad (7)$$

- ▶ $W_m = \sum_{q=i}^m \frac{1}{2n_q} D_q$
- ▶ for each m , n data set $X_m^r, r = 1, \dots, n$ are generated, the estimated size of cluster is obtained by maximizing:

$$Gap_n(m) = E_n(\log(W_m^r)) - \log(W_m) \quad (8)$$

Questions

Hard Clustering Indices (Cont')

- ▶ Information theory based criteria:
 - ▶ criteria function

$$C(\theta, K) = -2L(\theta) + \phi(K) \quad (9)$$

- ▶ $L(\theta)$ is the log-likelihood function
- ▶ K is the order of the model - dimensionality of θ , ϕ is an increasing function of K
- ▶ K is strictly increasing function of m

$$K(m, l) = (l + \frac{l(l+1)}{2} + 1)m - 1; \quad (10)$$

- ▶ the goal is to minimize C with respect to θ and K
